

## PROGRESSIVE DEVELOPMENT

### Prologue

The International Interdisciplinary Journal on Environment is on the verge of getting in the need for changes due to the evolving pattern of reading as capsules that each journal here after will contain capsules only either by single author or by several authors contributing to same topic. As ever, I stress again, the benefits of research to the finer details do not add value to the holistic living and progressive to improve the quality of earth as the soil structure itself is an evolution of the rocks underlying and we cannot create anything to support the existence of earth which is eternal, but we need to accept the changes it imposes on us, and get alerted for the signs it shows us through the changes.

**“It is we who ought  
to be protected  
from the disastrous  
effects and not the  
environment as it is  
eternal and ever  
evolving”**

The disasters as Cyclones, Tornadoes, Forest fires, Floods, Earthquakes, and Volcanoes are the symptoms that anthropogenic activities are into disturbing the balance of nature. It is we, and our generations who have to be protected, not the earth. Hence this

special issue on progressive development has been brought about to indicate the key elements to be focused to balance nature. Since long time we were addressing about sustainable development which means meeting the needs of the present without compromising the future generation to meet their own needs.

The environment has degraded to the maximum extent possible that we can no longer sustain it for the future but promote it progressively to retain its original status. As we aimed for sustainable development where the pollution control is kept as the key point, and we could succeed only to a limited extent for various political, socioeconomic reasons, we need to get shifted to pollution prevention as the key principle for progressive growth that there will no longer be pollution load added to the environment. When there is no further load, the environment has the natural assimilation capacity that by self purification, it gets purified, and proceeds progressively for better positive evolution. This is a forward looking move to positive, complimenting, fair, judging criticisms constructively to get a shift to swift growth and attain favourable environment to be humane ever.

## PROGRESSIVE DEVELOPMENT

### Introduction

In the stages of sustainable development, the growth was felt as the national growth that each nation was into controlling the emissions in their own regime but failed to integrate, that there were incidences of waste disposal in the neighbouring countries, oceans and the new policy agreements focussed on self centric approach. Eventually we faced total environmental degradation world wide as we can have the regional demarcation for the purpose of governance, but the environment is common from within all the resources and has no boundary.

The degradation must be felt universally and is being the recent ambitious meet at Copenhagen, which had many disagreements. Though there are very many explicit reasons, the implicit reason is the consequences felt by every one as air atmosphere, climate, weather pattern could not be dealt regionally. This is the reason why the meetings on climate change do not give promotional outcome when every other including the nuclear agreements gets accepted mutually by the involving countries. As it is felt by every leader, there should be

the mindset to go global at least now by action to create the world of oneness. The focussed minds knowing their strength, limitations, prospect and risk of their own, should set their goals of their development, acquire what is essential and cooperate with other countries in their steps to grow. There should be only cumulative growth measures and not exclusive growth measures suppressing others by any way.

### **Resource conservation**

The resources are to be conserved as their rate of replenishment is far below the rate of use and mindless use of resources add to waste volume thus degrading the environment. This also affects the economy as the wastes count when bought as raw material. The control measures on the direct impact on the environmental components for the principles of environmental sustainability decreased the pollution load and the industries turn towards zero emission technologies. The scarcity and degradation of the resources is not only due to the abnormal use of the raw materials, lack of conservation strategies and waste disposal, but due to increased consumption, unethical product promotion and multiple use of products in lieu of one and all these are accelerated by exceptional cash flow as fiat money. The focus of the

progressive development hence on the resources is to time, power, desire, knowledge, and space.

Time is the basic entity which manages the best of the output of every other activity; it has to be given preference among all other contributing factors. Time available to any individual must be balanced in such a way to get the maximum efficiency. The computer has gone into every ones' essentials that there is no need to segregate office hours and personal time, and work from home could be promoted. The ever expressed fear of lack of monitoring could be managed by measuring the volume of work done in a day and not the hours spent for work in a day. This not only saves time, but improves efficiency as there is balance of home and work environment which was expressed by most of the working people in the recent surveys.

The service must be recorded not as the length of physical presence but the volume of service exerted. The promotional features earlier were to the seniors which later got modified to the contributing, which gave an incredible social calamity though not accounted till this time. It would be better to go for restructuring every five years that every one on accomplishment of set standards gains a promotion in

parallel, the hierarchy must be altered to the opportunity for everyone once the set standard is reached and which do not include years of service.

The strategic plans are to be prepared by each individual and are to be assessed for the potentials required and the individual must be encouraged to reach the requirement. There should not be comparison with other and this will initiate time management by the individual effectively that he concentrates only on him contributing to the growth of the work place which will get reflected in the social and global growth. Not to intervene in others freedom by any means is the best social awareness one can have. "DO YOUR JOB" is the slogan behind the successful individual. When this is implemented, electronic communication will come into existence voluntarily.

Potential resources are the intelligence resources with capabilities of human beings cumulated to human resources globally. These resources are to be conserved as positive resources in a constructive manner to offer the service for promotional features of an individual or society ethically. It is not the materialistic intelligence which is short term and superficial that adds to the economic growth

but the ethical intelligence which is long term and motivating to surpass all others. Potential intelligence is to be built enhancing the self not only externally but also internally.

The spirituality and enlightenment should come into one's mind that he must be able to point one who could do justice to a job among the group which includes him without bias. This may seem to be impractical, but very much possible if the joy of giving is unfolded to him which is evolution of the brain activities to mind activities to start with for an individual and goes global once transcendence is reached. At that stage there is a complete confidence of one who can point himself to be the fittest for his aspiration. This attitude contributes to complete execution of responsibility to the extreme that the system functions to the best. Needless to say the profit will be to the peak ethically.

Knowledge resources are the professional know how for the authenticity and scientific existence that is required for the material well being of the individual and the mindless performance of the profession is the reason for recession in economy, society and environment. The technologies are ever evolving and concerns are

meagre on the negative implications the technology offers to the ecosystem. Every demand of time and necessity has many different solutions for the technological efficacy and the profound knowledge of the system as a whole, its integrated components and behaviour from within and outside it, provides the effective, economic, best performing solution which is eco friendly too.

Spatial resources contribute a lot to conservation in the competing world of space scarcity for living and working environment. Poor focus to this result in mental instability which in turn affects the performance and emotional balance of the individual and the society. Sound, colour, smell, taste, touch fills the mind, to transform to soul that they are the elements to be arranged to boost the sublime state that the better efficiency is obtained. The transformation of the mind finds its best output wherever it is which is by continuous practice stimulated by all these sensory feelings satisfied to the level of individual at least as every individual is unique.

The smell of some flowers, colours are stimulating to one which may be depressing the other and hence a choice is to make it to the cool, low, extended soothing transcendental choices. The scarcity of

space necessitates the capsulated form in anything and everything that the small space can be made brilliant by this internal adornment. Buildings are to be compact leaving more of open space for connectivity among the elements of environment. Use of virtual space as working platform and saving records to the maximum conserves resources.

Desire makes the man live. The desires are the goals one might wish to achieve, to move ahead, to reach the aspiration, and which makes life purposeful. It must be so chosen that it is not greedy, pulling down others, but a wish promoting self and contributing to others. Acquiring a skill, achieving a preset goal contributes to the growth of the individual, and everyone concerned. But the greed, materialism makes the individual go unethical, taking up wrong routes that lead to personal disaster which is the reduction in longevity of life in general, underperforming dependents which then make the life purposeless though the material possession may feed generations together. The drive to achieve effortlessly in a straight way makes the difference between desire and greed.

## Energy

Climate change is the threatening concern of every individual which need to be understood as it is, and not from the basic as we have travelled a long way ahead and could not go back but could certainly manage constructively. Green house effect is adding to the sustenance of room temperature whereas global warming is increasing the average room temperature everywhere that it needs to be curbed. With the principles of sustainable development all countries do give strategies to control the emission of green house gases and succeeded in the same. But not all the sophistication be given up and getting back to stone ages is practically impossible. Understanding the core of the issue much ahead of the source, suggests that the heat accumulated in the environment is also a form of energy that could be tapped and reused.

According to the laws of thermodynamics, this evolved heat out of green house gases could very well form an assuring source of easy energy source in the existing scenario of energy crisis. When solar energy is the radiation from the sun as light giving to energy through photoelectric effect, this infrared radiation amounts to high energy phenomena that pair production gives a better alternate to

conventional energy reserves and serves the total demand of the society all over the globe. The energy crisis and conservation issues are seriously dealt in sustainable development principles, and we move ahead of non conventional energy sources to reusing green energy, as it follows a cyclic pattern and results in zero emission as heat, that climate change is brought to control, which at the same time provide energy reserve.

### **Cautious Consumerism**

Consumerism is the key factor to many of the corrosive effects of sustainable development that in the progressive development it needs to be focussed as mindful consumerism. Where green consumerism accounts for pollution control, cautious consumerism accounts for pollution prevention. The abundance of money enhances the mindless spending; most of the purchases get into wastes without meeting their life time, and becomes unmanageable too. Most of them are toxic after expiry, when react with natural forces. Cautious consumerism reduces volume of electronic wastes, combustible waste as paper which set revolution in waste management to the level of source of generation. It must be taken as satisfying the individual ethically as going back to the initial stages to save the environment will not happen at this stage.

Stretched mind will never go back to its original position, but for the impacts could be altered. One product in lieu many different of the same kind could control the situation to the best.

The addiction to buying are due to emotional disturbances, anxiety, in search of social recognition, external bliss to improve appearance and as a stress management tool to pass away time. The factors that promote cautious consumerism are virtual shopping, voluntary simplicity, balanced work –home environment, detached life in connected world as to contribute to others in need but to refrain from other social get together which forms the platform of negative emotions to the individual, if the same is formal.

### **Equitable society**

Social awareness is to be conceived as refraining from the activities that ruin the doer, society in the short or long term and to give hands for the needy when and where we can. We need to treat every other with human dignity and feel they have the right to live their life as we are. No social activities should commit any one, but must be from the mind voluntarily. The non governmental and social organisations are to be reformed to take no lead but disseminate

awareness by demonstration that the beneficiaries come to know how to live on their own. The phrase used in social activities is to be focussed on “Me and you” which is society. Since by the watch word “Not me, but you” ,individuals’ human dignity is not given enough significance, the transformation to the next level ‘Me and You” is not evolving, leading to social calamities with accumulated toxic emotions as blame, self blame, vengeance and so on.

It is in the state of mind the sublime qualities compassion, sympathy lies which results only after self is satisfied both externally and internally. Till that stage of enlightenment is reached, the qualities expressed as emotional control are pretention that lead to accumulation within and consequently the human well being, physiologically and psychologically gets affected. The whole of global society is to be looked upon as group of local population regionalised only for administrative purposes and growth is towards global welfare that policy, instruments, treatise and conventions are to form convinced global participation rather than interested groups. All the resources available in the universe are under the custodial preservation of a specific group which should not be conceived as authority but responsibility. The equitable concern on sharing in view

of use, prevention is to be instilled in the minds that the public properties are not to the surveillance of governance but to the beneficiaries.

### **Governance for public**

The governance should be completely transparent and every communication made from and within the departments must be in written mode through electronic means to avoid delay and remain recorded for the progress. The mounting of cases with the judicial system and the law enforcing departments are mainly due to the mindless discharge of duty of the departments which monitor, maintain law and order. The file transfer and forwarding need to be done online to make the concerned well informed of the issue that transforming from conventional into electronic governance make the conduct of court and enquiry too online. This action considerably conserves reserves and lead to orderly conduct of code of ethics without bias.

The authoritarian approach need to be given up as the responsibility is for public and the public need to wait for the justice as it is mandate and do not go for influences. The legal instruments are to

be popularised and the enquiry procedure be made easy. The procedural norms are to be made transparent that there will not be iniquitous activities in the official procedures, above all the harmony need to be maintained for progressive development. Accepting that each one has unique potential that all need to be encouraged for equal participation, contribution, incentives and rewards are to be given for personal achievements and not on comparative basis.

The awards are to be fair that each individual for the best of his contribution as given by his own strategy receives due incentives on accomplishments. The bottom line is that every one deserves due promotional features and gets convinced of his dedication at every stage. The elections are to be conducted on virtual platforms, the polling, the proposals of the contestants are to be restricted to written form online that the virtues of the politicians will be always under progressive mode to contribute better and this leads to contestants of the opposite parties give their promises and appear on the same virtual platform of government for campaigning as authenticated media of democratic election.

The parliament activities are to be made online that they remain transparent and recorded as could be seen any time by the involved to think and respond. This makes the members of governance to remain in their own place to look after the local development. The government is in to transforming all records into virtual keeping that minimises its time and improves speedy measures. The focus should be given on to training the employees with rules, procedures and computer operations and the unemployed youth be involved into these activities that we progress much earlier than expected.

The Preamble of constitution must be strictly abided by any country to rule for the people as the members are elected by the people. The preamble the basic core of human existence to live peacefully being expressed in almost all the countries in their constitution, the same alone need to be referred, doing away all the specific rules and amendments made in the constitution to generalise the issues, understanding that we can not rule for masses as they are all individuals connected with each other for carrying life complimenting each other and not to come down in performance, perception, to be in line with others anyway. The UN constituent countries are to simply adhere to article 1 of Universal declaration of United Nations and they

need no conventions, treatise etc. As the preamble of constitution and article 1 of universal declaration are certainly sufficient to bring in peace throughout the globe, and the subsequent activities as separate treatise, convention, articles are elaborating each sector which need to be construed as belonging to an individual and can never be generalised for which we make lives complicated when the simple solution is available in hand to every one.

The law and order must be divided to involve more intrinsic components as the same is experiencing a lot of difficulties with mounting cases and petitions which for not being solved due to the inadequate knowledge, man power, influence and mindless performance of jobs, lagging dedication and need of the service, the same is taking up a shape to permit more unethical existence of every system legally. This is damaging for being transferred to the successors, the youth and the intricate components as human rights, right to know information make them establish justice for individual. When this is focussed there will be solution on orderliness of the nations at large. When an individual objects public meetings indicating the nuisance, the individual human rights need to be respected that the same will be cancelled and for which the damaging consequences inviting rivalry will

be avoided but the purpose of dissemination of information is met with an alternate. The right to know information makes an intermediate level of check of the authenticity being construed as authority and for the benefit; the individuals give up objecting but move to cooperate authority which got established to the core that they take doing their job is to be paid by the individual as bribe. This is in existence right from the policemen attending to enquiry to the accreditation and approval committee assessing the performance of the same. When the information commission is linked with the public information officers of all the departments and organisations as a separate department, it monitors, regulates the government procedures done as per norms, that the cases piling up with the judicial system will be avoided and in this case they will be taking over the maintenance of law and order for the police department who could then work on orderliness alone. When these do work on maintenance through monitoring and for arbitration, the judicial system will receive cases much reduced and which are intensive and serious enough to deal with the issues relating to departments, governance between states and move to establish international justice for global peace representing the problems of the governance, across the states, across the nations and so on. This is possible with e governance and transparency. This gives space for the

learning to be life long, even the judges are learning throughout their life and none in this democratic country can say the judgment by the judge is final; it is the conviction of the involved, which is final, for the ignorance of information to be included and finding ways to establish conviction. When it is procedural to appeal to a higher authority, the same affects the governance fairly for influence, and ego that the one who gives judgement , must be involved to convince the involved ethically with human values and not with the rules. The legal advisory in the existing scenario is interpreting wrongly to the cooperation for influence which is not expected out of them. They have to establish the rules what it exactly mean that the amendments, conventions are to be stopped and the issues dealt as such specific to the individual.

### **Web enabled services**

When every thing gets online there are more opportunities for web enabled services and securing the flow of information with due authentication from the governance. All the servers should come under the monitoring of the governance. Automation gives job prospects to more of village youth to get into providing web services and women at home may also be inducted into this. It must be borne in mind that the automation should be to the data storage and humanity and individual

dignity need to be respected and given due privilege when the data gets transferred from an individual to governance that is where the man power as human potentials will even be in its best of performance. The ever remaining belief that the computers make man jobless, is baseless, the man power, their intelligence is shifted to decision making, when the monotonous and laborious repetitive jobs are assigned to computers which will avoid errors due to fatigue and external forces of influence. The output thus gets refined to perfection ever.

The objective to bring in electronic governance need more people for automation and data bank generation that the youth trained with certificate courses will get employment and an uplift of status in the social structure too, this will create job opportunities which could be focussed on the underprivileged and economically weaker section that we reach 100% education and employability.

We got to learn from the past development experienced by the influential countries that the automation took place with highly qualified people as software professional as it was the period of computing and web services getting introduced and now since it has

been popularised sufficiently the governance need to think of introducing vocational, certificate courses on web designing, maintenance and data bank operation to give job opportunities to arts and science core that the engineering pool will get back to its core which is also in demand for the interdisciplinary approach to emerge for more of expansion in each discipline for the development in each sector.

The biological clock of the human beings are affected by the changing life styles and work pattern in shifts and during night that the individual working in call centres, Business Process and Knowledge Process outsourcing, are to be transformed to better working pattern by recording the source content and doing the job during the day time. It not only affects the longevity but also the imbalance in life as inefficient role played in the family reflecting on the peace and output of the members especially children. There are transcription software's coming up in the recent times which create the word script if dictated and which is believed to put an end to this exhaustive job opportunities taken widely compromising health for wealth.

## Infrastructure

The exponential growth in urbanised sector experiences space constraints due to which the cities extents widely that the civic settled in the remote areas travelling more than two hours to their work place is common nowadays and the boundaries are almost touching the other cities that there are no more the connecting regions in between. This saturated horizontal expansion demands an alternate which is not certainly demolishing the existing developments but to augment them vertically. Constructing skyscrapers is a wise idea as capsulated colonial expansion always contributed to urban growth.

The residential colonies with all basic amenities like commercial, health care units integrated with them horizontally and in many places their work places too as IT parks along the horizontal expansion resulted in enough saving with twentieth century infrastructure development, the twenty first century development provide scope for the vertical expansion that the activities which need absolute spatial existence as residential and health care are to be clubbed in the same apartments with door service commercial activities which need only the storage space then for their activities and connectivity as fly over to have access to multilevel floors with vehicles made possible.

The commercial activities need to find place in virtual mode which will save plenty of space and so are the recreational activities to the roof tops, with all these there will be sufficient saving in horizontal space that will provide a spacious pacing In between that we feel comfortable with ever improving progressive development that we accommodate, manage the evolution and not control them including population. The advancement in finite element analysis and shell structure made more light weight yet strong structures possible and research on composite materials contributes to progressive growth as steel need to be supplemented with alternative reinforcement for its scarcity and adding to dead weight. The reinforcement alternatives as fibre and natural elements as bamboo integrated with thin steel reinforcements as encapsulation add to the light weight structures. For the quality of materials and design period, it is always preferable to go for structures which live short span that it results in economy and provides ways to remodel, alter, or rebuild without wasting the resources. This meets the frequently changing passion too. The studio type apartments are picking up in the living pattern, which involves everything in the same hall to accommodate every need of human living with comfort, space for individual, yet making life peaceful and enjoyable.

Think of the life where the computer accommodates most of your needs to your door steps. You can work, enjoy playing games and watch TV, listen to music, eat light food when you feel hungry, do up your jobs by yourself, then you don't need dieticians, doctors, health clubs, recreation and so on, you live for ever, contributing to others in a simple way. You don't need restaurants, you don't need holiday resorts, you don't need fitness centres, you don't need complex medicine, you don't need assistance from others, you don't need to know the rules, all that you need is finding life in everything, giving space for deserving and get what you deserve and that is what the comfort zone of an individual defines. It makes every one responsible, it makes every one to self realisation as then the chances of finding reasons to blame upon are practically impossible that the performance will be best.

When your health condition is not permitting you to have heavy food, the same is prioritised than you being referred as sociable by giving it up for compulsion in the name of courtesy. Not only heavy food, it could be hot drinks, it could be personal benefits, it could be external pressure or it could be en a threat, the priority is your well

being and there are ample number of ways to tackle critical situations constructively. If one is not materialistic, and aspires for celebrity status, he could involve every one in his circle of influence very easily and that is the personal trait required for a healthy living. Infrastructure communications, transportation, road and rail network, in short the ways and means to remain connected, socialise, share, transfer to include everything around us mutually get benefitted that it would be the best of the virtual space is utilised. Many things could be achieved if communicated to one for the purpose of communication.

### **Education**

As the progressive growth needs interdisciplinary approach, the higher education need to be choice based with the freedom to design ones own course with interdisciplinary subject that one projects him unique in the forum. This makes him responsible, inclusive, and persuades him to expand his knowledge wilfully and excel without force, by involvement. The education should promote knowledge mining and experiential learning that they get enough expertise while within the curriculum , it has been reported in the ages of sustainable development that the psychological well being of the adolescent is

tested for the comparison and expectation of good score in the education, where the purpose is to gain expertise through exposure.

The industrial training and experiential learning should supplement with strong course scripts and guided learning make them confident to produce innovative and creative projects and emerge out as competent professionals each unique in their own way to support to progressive growth. We need legends and not masses which could be made only through holistic education. The practices in primary education to higher education need to be focussing on web education that each student has personal attention from the teacher and the teacher plays the role of guide, mentor and philosopher to make him focussed with strong fundamentals learn by him. The students need to get hands on experience to learn the concepts and put more questions that they get into logical reasoning and each one will then be unique in their output that they form a strong yielding work force when become the professionals.

The village schools and urban schools are the distinction in the category of education as urban receives information through internet and experiential learning and village receives education through

computer and vocational training that all will have progression in their growth from their existing level. Transition for existing status to a higher level is always the driving force to evolution. The tribal schools are to be focussed on the art of living with specially designed curriculum with education involving the carrying of daily life with applied knowledge integrated with small scale entrepreneurial training and assured related part time jobs while learning with commercialising natural products. They are experts with their understanding in nature and their curriculum be on life sciences and literacy, nature based and give them interest to involve in education. The income they earn with integrated training in natural products make them entrepreneurial that they remain connected to their nativity, exploiting their environment to the best.

Their priority being earning to survive, this curriculum provides those ways to earn and learn that they make complete inclusion possible. This way of exceptional curriculum for each demographic status makes quality education for all with inclusion, expansion and excellence achievable with immediate effect. This is the way the reach of technology could better be manipulated for education. They learn literacy to explain their experience and that make them expressive and

care to learn for they experience the need to learn literacy to express what they experience in their day to day life that they feel the significance rather than learning regular curriculum as a need to grow for better life styles absolutely different from their native, which is destructive. Each component and connectivity needs to be understood as they are, and are to be lifted without destroying their hold to native. This way helps environment too to grow with us giving us the best of it.

The biological clock of man indicates that the better attention be at 10.00 AM and will remain till 3.30 PM after which it gets reduced every day that the learning process within the curriculum be designed to be between 10.00 AM and 3.00 PM which also maintains a balance of knowledge and wisdom with exposure outside the world. The home work assignment and projects are to the innovation and creativity of the individual that he learns the world on his own with his own level of interpretation and the appreciation he receives make him to be relaxed and enjoy learning. The stress relieved for examinations make him focus to the core in his own pace and thus we reach the purpose of education as man making process. This makes him self competent and responsible that he will set to understand others as they are which is

core for relationships and human values. Every one should use equality for his best of living.

### **Human Culture**

Progressive life style pertains to ones' self and is not reflecting any other. It encompasses the patterns that one feels comfortable to carry on his personal and professional balance in a relaxed way that it enforces no dress code, no philosophy, no code of conduct, no policy enforcement, no stipulations , but a liberated free comfortable environment for every one that there is no authority but only contribution at every level of stake holder.

There is no restrictive pattern of living but plenty of ethically bound principles to contribute to global civilisation. In this the tradition, culture, heritage, custom, ritual are all transferred from one generation which were local and regional before global shrinkage through virtual space , but reformed of only contributing to human development respecting human values as they are, unless otherwise intervened. Here we could remember the understanding of existence to holism as being as a being to gain human values supporting growth. We do understand being as being, ever , but we set limits that he is

permitted to continue as he is even when he is destructive and we take care only to the extent that we remain protected from his corrosive attitude which is not inclusive. We ought to protect ourselves from his corrosive emotions at the same time take measures to indicate him of the consequences of his corrosive emotions, wake up his conscience, towards being ethical that we contribute our share of being a stake holder of the system.

We were not to this level of gaining human values, though the individual rights have been well established much earlier after the second world war because we need to take efforts straining our selves, become selfless like the great leaders to bring in changes then, as there are no means to have a balanced professional and personal life, contributing to society. Now that the procedure of governance, could be made simple, that every individual can go to the extent of fighting with authority for human rights, yet can lead a peaceful balanced life and this will be taken to entire civic, with electronic governance that the potential reserves suppressed for not being authenticated, is eliminated. Any proposal and scheme of government need not depend on the report of the committee, but on common civic, who could give a unbiased suggestion to improve the governance, making his

authentication and reach as common man beyond boundaries. This does not dissolve the powers of responsibility of any one, but adds to their performance as when the idea comes from many and executed for the cumulative effects, the benefits are for majority and so are the credits.

Progressive growth is not on preserving the old traditions and culture as main profession of the involved. The folk arts, crafts, are to transform to new modes if possible and registration of the same for future reference will go a long way as we have references for the ancient civilisation. If no promising progress is envisaged on its own, the involved should take up an alternating profession to bring their life to the front, and should not expect support from UN and the government which will be misleading for generations together, as giving financial assistance for the same make them fixed to a profession which has no growth by itself that even their generations will be stagnated and hence is short term assistance, damaging too. For the life taking risk involved as bull fight in villages, they are to be transformed and not to be promoted. The lifestyle is to the comfort of the individual until it interferes with others and so is the dress code. It is not all these to be given significance in the development to be

progressive, but to the attitude of accepting every one in their due place without corrosive emotions.

## Equality

When equitable society deals with the equal rights a group or community should exhibit for existence, equality the potential every one should possess to carry out their equality to maintain their individual space. The gender parity is another issue on the agenda of sustainability but still persists in transformed mode and the use of virtual space provides effective contribution and participation of every potential hand into forming a team irrespective of gender. There is no gender parity in the corporate circle even now and they work together as team but there are violation from the ethical existence due to extreme sophistications they enjoy and opacity in the promotional schemes. Maintaining the technical expertise on tops is demanded, which keep them all in pressurised situation which induces anxiety and insecurity causing reduced longevity. The target is not the time, but the proficiency which will come only through hands on experience and with self confidence, that the civic need to gain mastery over their jobs that they need not find ways to stick to it unethically and find it difficult to perform for they don't deserve it for their credentials.

Natural resources though comes within the regime of different states and are used by many states, countries, they are to be considered as common resource to be shared equally by all the beneficiaries irrespective of its origin, run and destination with respect to water sources. The education sector is another area where equity is to be implemented as it is the fundamental transforming phenomena for ethical development, it needs to be of world class, offered free to every individual and informal education as an opportunity to drop outs, and getting back into stream by the discontinued, not considering the attendance physically but completion of the assigned task for a particular day adds to meeting the goals of every governance progressively. This makes every student be equally treated for their unique potential and enhance their self competence that there will be no more comparison.

When the minimum to pass make them move up with deficiency, which will reflect in future, the self paced complete learning to his confidence make him establish as he is and move up in the direction in which he can be comfortable exhibiting his mastery. This claims his self dignity and respect. Setting a common standard and assessing him for

the same to shear his skills is destructive, as we design his life, where as, being his stake holders we need to gear him up for his best. One could merge his expertise and interest in his own way that gives up numerous projects each contributing to the society at large and at least to him for his involvement. This confidence gained over the skills, boosts his proficiency and he deserves self dignity which will not be given by others, but taken by him. Equality to an individual is pertaining to the skills, where the equitable resources are pertaining to the opportunities made available to every one. The individual should take care of Equality and the governance the equitability that progression will be achieved altogether.

### **Economic instruments**

The economic development must be instilled with ethics and that must be brought in to reality by heavy tax on non ecofriendly technologies as bottled drinks, water, electronic products and the like. The detrimental health implications due to all above are well established that there must be stringent measures like heavy tax to decelerate them. The employees are to be relieved from tax completely and the government should enter into new promotional projects to generate revenue and remain self sustained.

The financial audit of the budget plan executed should have the audit of the unwarranted expenditure in every department that must be explicit too which will improve mindful expenditure in the subsequent years. No activity should derive lavish, hasty expenditure and is to be borne in mind that the funding is from every citizen for them. All official communications must be done through internet and the facility be provided every where for the same is to be taken as urgent action fulfilling the basic criteria of meeting the time line with efficacy. This auditing does exist in all private, corporate and industrial sectors and not with government that the dilution occurs. The undue expectations form the governance to do their jobs are in the way to add to the price of the commodity reflecting in common individual and which in turn reflected on the entire economy.

The salary structure of every employee must be in par with that of the escalated soft ware professionals demand their due contribution and world class that there is no drive for illegal secondary income leading to curb corruption. All these are possible if the national funding blocked in unauthorised accounts with Swiss and Euro banks be taken by the government, which is a universal scenario. The powers with the

governance as the president and governor being the head of the nation and state are to be practically implemented that the same can pass bills to promote national growth as all these blocked money if brought to stream could increase the GDP to combat global recession.

The United Nations has responsibility to include all the nations to bring this unaccounted fiscal resource as an instrument in the convention of prevention and control of corruption. It is to be borne in mind that this easy money makes people go unethical that kills humanity and harmony which is to be given priority, as the same will certainly accumulate to holocausts and social calamities. This is the root cause of natural calamities too as the greed supersedes the concern for nature to account for its capacity to replenish.

The financial reserves and gains for and out of nuclear activities are to be stopped at once to give hands to progressive growth as mining of ores and generation of nuclear energy is disastrous to the core of earth's stability in addition to the negative impacts on the miners. Needless to say they build the energy reserves of the earth, if removed cause serious imbalance in energy flow and accumulation, leading to instability of earth which will give out disasters to

completely take away the ecosystem. The effects of nuclear radiation in the atmosphere are negligible as such. When compared to this instability of earth taking into account the energy bound in the ores, which is to mention of exponential magnitude of the disaster. To further this line of thought in detail, when we mine the ores for nuclear energy generation, the effects of the radiation will not be felt immediately as it is cumulative and get reflected in the long run where the cause will not be expedited for the benefits they receive certainly not the energy, but illegal monetary gains. For the common man affected with the implications, the effect felt much beyond the immediate vicinity can be closed simply the reduced longevity. The sensors and the radiation level monitors function for the authority as when they show levels within threshold they are reported to be functioning well and when they are above the threshold limits, they are reported to be non functional. The greed has taken the knowledge aback.

The energy is there everywhere, in every part of the universe, in different forms and modes, in easily available form to the complex compounds which are the reserves and not to be touched for direct exploitation and which keeps the energy flowing uninterrupted. The

sun is the source of energy, wind, water, thermal power are the readily available mode with which the energy needs can be met, the energy source below the earth are the reserves from where the energy flows to regions of need that they should not be disturbed. Coal, Lignite are one form of energy reserve, where as the ores of radioactive substances are another reserves, they will be released to the level of absorption without causing disturbance to the people naturally which maintains the balance of earth too. The mass need not be high; the potential reserves need to be weighed. The nuclear fission and fusion reactions are to be strictly natural and if induced will cause instability to earth. The earth has continuity and it has reserves of energy in various levels and the potential with which particular mass of soil transform itself to hold the energy, that particular part gets saturate d with energy and the excess flows further and maintain horizontal dissipation and balance. If this is interrupted with mining, the same will cause imbalance and break the continuity in the flow of energy that the nature explodes as calamities for not withholding the energy safely and dissipated for better human use.

When this is true for all mining activities, is specific and much pronounced for nuclear ores as they bind enormous energy within a

small mass and keeps on emitting whose life period is indefinable and we have half life period. Radioactivity though seem to be safe after the half life period for its reduced intensity, it still affect the life cycle of ecosystem as the intensity in the reduced form affects minor organisms and which will have impacts on higher forms of life. Artefacts can never balance and substituted in lieu of nature.

### **Conclusion**

Progressive development is ethical, convincing and promoting every individual in his personal and professional life that he contributes his best adding to the growth of the globe, being a satisfied individual. In the components of the ecosystem, where the sustainability is reached, by practicing the principles of progressive development, we experience phenomenal growth and where the environment is in degraded state, we experience excellent improvement. Overall outcome of this progressive development evolves generation after generation reaching the climax, the idealised end point of successive evolution, where actually we enter into sustaining the serenity.

The changing climate, inundation, tectonic movement, volcanoes, forest fires, tsunami, land slides indicate the earth is still evolving

primarily due to imposed loads of anthropogenic activities and the climax of the complex community extended for globalisation with myriad contributing factors , is unapproachable. As we enter into progressive development, there are ample of promotional aspects for ever evolving constructive environment that the world remain in peace without the fear of war and extinction to give space for existence generations after generations.

It is we who can make the world in peace to prevent the third world war, more of calamities, disasters leading to absolute holocaust of humanity, as the earth is eternal, universe is eternal which evolve continuously. To progress ever on the long term constructive benefits, we need not care for nature but for ourselves as nature if left undisturbed can take care of itself with its own assimilation. We need to take only what it gives which is abundant and yet to be explored but not to take from its structure which will cause imbalance in its stability.

The commercial system need to be reformed to commodity basis as the fiscal reserves equated to natural reserves do not justify where natural resources are gifts to humanity to be shared equally across the globe and the fiscal resources are printed on paper and fixed by human

ease to exchange and possess, as fiat money. Greed to possess more and more had made this transaction impractical for progression that a global policy of equitable reserves has to be evolved. This means the country with affluent natural reserves and productivity should have low global currency equivalent and those with low natural resources and productivity should have high currency equivalent in the global transaction that the flow of economy be balanced and we will have an equitable global mass in every aspect which is the objective of globalisation. This will deprive poverty and migration too.

This will encourage native consumerism and the countries which import reserves, are imposing load on the country exporting good to disturb nature that we loose the source even. Every country is given with the need to establish life in a comfortable way and in their own way too, the strength are their assets which need to be kept for their natives, human intelligence is the only resource which will get multiplied and that alone be the resource that can be offered to others either as voluntary service or charged service depending on the need. The exiting financial scenario imposes the urging need to enter in to global currency policy and all contributing countries are to identify their due role in the same with G20 summit and merge as global

population to live the best of our lives specific to the individual. What is in excess can always be given, but what is in reserve must be for preserving the natural status and for which an alternate need to be found. Between the extremes lies the calmness. Between the poverty and richness, lies the absolute calm which is unique for every one assuring satisfaction and is the stage of giving where we begin to live .
